Ask Assistant

- Using a custom prompt without selecting any text to change, provides two options:
- `Full Context` - Takes the entire context of the note into consideration for the request. Useful when you want to create something inline with previous text. `Enter` to select
- `No Context` - Is a fresh slate on your prompt. Useful when you want to create something without baggage of other writing methods. `Cmd + Enter` to select
- A new option to `Insert` the response to the note instead of replacing the selected text is available.
  - If text was selected before using Ask Assistant, insert puts the response a line below the selected text.
  - If no text was selected, insert puts the response at the position of the cursor.
- Changed the design of the action buttons.
- Improved error handling.

Natural Language Date search for Doclinks

- Use natural language like `today` `tomorrow` `nov5` inside `[[` doclinks to link to daily notes. *(Option only shows up if a daily note for that date has been created)*

Improvements

- `Settings → AI` now has a `Copy Key` button to copy the api key.
- `Settings → AI` now has a Deactivate Integration button to remove the OpenAI configuration.

Fixes

- Fixed an issue where copying articles or html from a browser would not paste the images.
- Fixed an issue where external links would open inside the app window when clicked inside `doclink` hovers or the changelog.
- Removed the setting to choose whether deleted files go to Trash or are permanently deleted, as it would require additional permissions from the OS, which resulted in crashes. Deleted files are now permanently deleted by default.
- Fixed the error background color for Cyberpunk theme.
